Assessment Report For Supply Chain Automation Project

Objective:

The main objective of the organization is to merge departmental datasets and centralized them making it easier for anyone to understand what is happening in different Sheets or at different tables. In short we need to provide a centralized solution to automate things a little bit.

Goal:

We need to make static pages with simple inputs to generate 4 type of reports from the data we have

First, They need description of data all combined or data report.

Second, The Diagnostic for overall faults overview to identify where things are going down.

Third, Prescriptive to suggest what things can avoid these down falls.

Fourth, Forecasting to predict how things might turn out in future.

In the end a chatbot to make things easier for simple operation like lookup, edit etc.

Assessment:

From overall inspection of datasets including the **Stock Value Report, Purchase List, and Issuance Detail** and **Logistic Department's Planning , Transportation and imports data** provide a solid foundation for developing an integrated Business Intelligence (BI) and AI-driven analytics solution. These datasets capture the complete material lifecycle, from procurement and inventory management to material issuance and consumption.

Overall, the assessment concludes that the available data is well-suited for building a centralized analytics platform that enhances operational visibility, optimizes inventory and procurement processes, and supports data-driven management decisions.

Plan:

- 1.Start with setting up Database and make data suitable to load in database.
- 2.Work on how the simple pages will look like.
- 3.Then work on how the reports will be produced
4. Make simple chatbot to look for Data base operations .
